Grounds for application.

Chronic pain is a prevalent disorder that affects severely the quality of life of patients after traumatic injury. The pathological pathway of inflammatory pain remains unknown. Some studies propose that substance X may be involved in pain syndromes. As the physiology of mice is very similar to human, mice will be used in this experiment in order to evaluate the role of substance X in peripheral and central nervous system and its pathophysiologic mechanisms.

Type of experiment(s).

Mice will be used in the experiment. Inflammatory pain model will be established by injection of Freund's adjuvant and complete cell suspension or formalin into the hindpaws of the animals. An antagonist will be injected intrathecally before and after pain model establishment to determine substance X and its receptors in the peripheral and the central nervous systems. A catheter will be inserted into the spinal cord under anaesthesia to facilitate subsequent multiple intrathecal drug deliveries. Non-invasive thermal pain behaviour tests will be conducted. In brief, a thermal stimulus (maximum level < 30 °C) will be applied onto the animals' hindpaws and the duration before paw withdrawal responses will be measured. During the experiment, conditions of the animals will be monitored. Animals with serious injury or showing significant pain will be euthanized by an overdose of anaesthetic. At the end of the experiment, the animals will be sacrificed by an overdose of anesthetic, and tissues will be collected for further analysis.

Purpose of experiment(s).

To study the nociceptive effect of substance X in chronic pain syndromes and the underlying mechanisms of pain using animal models.

Place where experiment(s) may be conducted.
